

Unified Cloud Repository for Membership Communication

Consolidated data from fragmented systems into a searchable cloud repository

Cross-Channel Data Integration

Project Schedule

February 2024 to December 2024

Client

Enterprise Membership Organization

Project Size

\$50,000 to \$199,999

Services Provided on this Project

API Development, Cloud Consulting & SI, Custom Software Development, Microservices Architecture Services, Computer Engineering

Focus Areas

Amazon Application Development Framework, Other App Platform, Other Programming & Scripting Languages

The Business Challenge

An enterprise membership organization identified a need to archive specific member communications across multiple communication channels. Individual communication channels are managed by independent systems with varying levels of member information and message duration. These communications need to be ingested for long-term storage and centralized in a searchable repository.

The Solution

REEA Global was engaged to develop a cloud-based repository that aggregated member and communication data from multiple independent systems. This solution created a unified, single view of each member and enabled internal users to efficiently search and review member communications in one centralized platform.

The Business Impact

improved communication across various channels

integrated multiple independent systems

leveraged existing cloud infrastructure

We don't just deliver software – we become an extension of your team, committed to your success at every stage.
